(01.501.002) Underwater Massage Tub

The Underwater Massage Tub allows performing a sophisticated form of classic massage in the water environment. Combining the unweighting function with optimum regulation of water temperature, the tubs helps the patient to relax allowing a more effective treatment to be performed. The water stream also provides optimum stimulation by performing the massage in distal to proximal direction.

An electronic panel allows the therapist to program the treatment for each of 5 specified areas - foot, shank, knee, thigh and hip - as well as for spine region. The therapist can program both treatment time and the sequence of areas to be treated.

The user has also possibility to skip any area where treatment is contraindicated for medical reasons.
